PROJECT OVERVIEW

Analysis of 56K patient records across 2019-2024 to evaluate hospital financial performance, payer mix, and billing trends for executive decision-making

DATA SOURCE & PREPARATIONSource: Hospital Billing & Patient Records (56K patients, 6 years)Tools: Power BI, Power Query, DAXCleaning: Removed duplicates on Patient ID, standardized Insurance Providers (Aetna, Blue Cross, Cigna, Medicare, UnitedHealthcare), Medical Conditions (Arthritis, Asthma, Cancer, Diabetes, Hypertension, Obesity), Test Results (Abnormal, Inconclusive, Normal), handled null billing amounts, created Date table for time intelligence.

KPIs & FORMULAS

- Total Billing: SUM(Billing[Amount]) = 1.42bn
- Total Patients: DISTINCTCOUNT(Patients[Patient_ID]) = 56K
- Avg Billing: DIVIDE([Total Billing], [Total Patients]) = 25.54K
- BillingLY:CALCULATE([Total Billing],SAMEPERIODLASTYEAR (Date[Date]))
- YoY Growth %: DIVIDE([Total Billing]-[Billing LY], [Billing LY]) = 22.98%

KEY OBSERVATIONS

- Revenue peaked in 2023, sharp drop in 2024 — needs audit
- Top 2 Insurance Providers drive >45% of billing — high dependency risk
- Diabetes, Hypertension, Obesity = highest billing (chronic conditions)
- Hospital billing varies 2x between top vs bottom hospitals
- Test Results: 33% Abnormal, 33% Normal, 33% Inconclusive — high inconclusive rate5.

KEY LEARNINGS

- Chronic disease management drives revenue
- Payer concentration risks financial stability
- Data quality in lab results impacts operational cost

RECOMMENDATIONS

- Renegotiate with top 2
- Insurance Providers to protect 45% revenue Invest in Chronic Care programs for Diabetes & Hypertension
- Audit 2024 billing drop (claim denials / policy change)
- Reduce Inconclusive Tests from 33% — retrain lab staff
- Benchmark low-billing hospitals vs top performers
